

Dylan Rajan Vig

New York, NY • (917) 868-8283 • drv36@cornell.edu • github.com/DylanVig • dylanvig.github.io

Education

Cornell University, College of Engineering, Ithaca, NY

Expected May 2027

Bachelor of Science in Computer Science, Minor in Operations Research & Management Science

Relevant Coursework: Foundations of Robotics, Operating Systems, Computer Systems Programming, Analysis of Algorithms, Machine Learning, Computer Networks, Optimization, Linear Algebra, Statistics

Technical Experience

Google, Sunnyvale, CA

Aug 2026-Nov 2026

Software Engineer Intern | JavaScript, Java

- Developing new Privacy and Security tabs for Gmail Settings, reorganizing sensitive account controls and refactoring legacy JavaScript delegate architecture to support a more modular and maintainable frontend.
- Building and instrumenting JavaScript telemetry and usage metrics for Gmail Settings, measuring ~8M unique weekly users and tab-level engagement to support data-driven product decisions.

Millennium Management, New York, NY

Jun 2026-Aug 2026

Software Engineer Intern | C#, Angular, SQL

- Implemented an internal automation tool that extracts daily financial data updates from unstructured communications and generates structured Excel reports, eliminating manual data collection and improving reporting efficiency.
- Built a scalable data comparison platform that versions daily price and market value snapshots for 2M+ securities, enabling rapid identification and investigation of data changes across reporting cycles.
- Developed an end-to-end deployment automation tool that orchestrates software release workflow from a Jira ticket by identifying relevant branches, creating pull requests, triggering CI/CD pipelines, publishing releases, and notifying QA with deployment artifacts, supporting 30+ engineers and reducing manual steps by ~90%.
- Developed an environment reservation platform that manages deployment queues across testing environments, providing real-time availability, automated scheduling, and notifications to reduce coordination overhead.

Meta, Menlo Park, CA

May 2025-Aug 2025

Software Engineer Intern | Hack/PHP, React.js, SQL, GraphQL

- Engineered a full-stack testing platform for a large-scale distributed content policy enforcement decisioning pipeline processing billions of entities daily, enabling 50+ engineers to simulate production workflows and accelerate debugging.
- Built an automated backfill system to reprocess millions of entities following pipeline corrections, enabling rapid remediation of large-scale data inconsistencies across production systems.
- Resolved 30+ failing test cases caused by upstream code changes, accounting for ~25% of outstanding issues and improving overall code reliability and on-call engineer experience across the Central Integrity & Support platform.

Cornell University Unmanned Air Systems, Ithaca, NY

Oct 2023-May 2025

Imaging Systems Software Engineer | React.js, Spring Boot, PostgreSQL

- Developed a real-time mission control dashboard for an autonomous aircraft platform, enabling live visualization of telemetry, camera feeds, target detections, waypoint planning, and mission replay.
- Built mission software to ingest, manage, and visualize 1,000+ records of camera imagery, telemetry, and target data, enabling operators to analyze flights in real time and post-flight and generate mission documentation.
- Designed and implemented a real-time sensor fusion dashboard that combines GPS, IMU, battery, and computer vision data into a unified operational view, enabling live monitoring of autonomous aircraft health, navigation, and target detection.
- Redesigned and implemented CUAir's target detection pipeline to support new competition objectives, collaborating with the ML team to integrate a 99% accurate computer vision model for automated mission target classification.

OnePay, New York, NY

Jun 2024-Aug 2024

Software Engineer Intern | TypeScript, AWS, Terraform, Retool, MySQL

- Developed an internal support dashboard that surfaced OTP email delivery status through a centralized interface, enabling 25+ customer service agents to rapidly diagnose and resolve customer verification issues.
- Expanded the customer support chatbot by implementing a new Amazon Lex intent for funds availability inquiries, automating responses for ~2,000 customer requests per week and improving self-service capabilities.
- Enhanced an AI-powered knowledge management system by integrating GPT-4-based semantic similarity detection to identify duplicate support content, improving knowledge base quality and reducing redundant article creation.

Mage Data, Remote

May 2024-Aug 2024

Software Engineer Intern | Python, Pandas, NumPy, Tensorflow

- Developed an end-user testing interface for a sensitive data classification platform, enabling customers to evaluate machine learning predictions on custom text inputs through real-time entity extraction and classification visualization.
- Built a hybrid preprocessing pipeline combining regex-based feature extraction, schema analysis, and data profiling to support automated identification of 40+ sensitive data categories, improving classification accuracy by 15%.

Skills

Programming Languages: Java, Python, C, C++, TypeScript, JavaScript, Hack/PHP, OCaml, SQL, HTML/CSS

Tools/Libraries: React.js, Remix.js, Redux.js, Node.js, Spring Boot, PostgreSQL, MySQL, Git, AWS, Terraform
